

BORDER-WATCH — ROUND 2 PLAN

Team ENDGAME ENCORE | SIH 2026, PS #26187 | Ready by 20 Sep, Demo 21 Sep

WHAT WE ARE BUILDING

Today, our system makes you **upload a video and wait** for the AI to finish before you see anything. For Round 2 we are upgrading it to run **LIVE** — like a real security control room. The camera feed appears on screen instantly, and everything the AI already does well — recognising a target person's face, reading vehicle number plates, spotting someone entering a restricted zone, flagging suspicious movement — now happens **in real time**, with instant alerts, instead of after the fact.

WHY WE ARE NOT USING NVIDIA / HEAVY ENTERPRISE SOFTWARE

- Wrong hardware.** Tools like NVIDIA DeepStream / TensorRT only run on NVIDIA graphics cards. Our laptops don't have one — it's simply not possible to run them here, no matter how much time we had.
- Built for a different job.** That stack is designed for big companies running hundreds of cameras across many sites — not a 3-day hackathon build by one person.
- Too slow to learn.** Even with the right hardware, learning and wiring up that software properly takes weeks. We have 3 days.

The good news: we already have a working, tested AI engine (weeks of real work: face recognition, number-plate reading, zone alerts, night-vision, behaviour analysis). Instead of throwing that away to learn brand-new complex tools in 3 days, we're keeping everything that already works and simply connecting it to a live camera instead of an uploaded file. **Faster, safer, and still genuinely impressive.**

THE 3-DAY PLAN

DAY 1	17-18 Sep	Get a live camera video showing up on screen — the video plays live, just like a real CCTV monitor, with nothing uploaded or waited for.
DAY 2	19 Sep	Plug in our existing AI: live face recognition, target tracking, restricted-zone alerts, number-plate reading. Add the siren (see below). Build the on-screen live dashboard.
DAY 3	20 Sep	No new features — only testing, rehearsing the demo, and recording a backup video in case anything glitches live on stage.

NEW FEATURE — THE SIREN

When the system spots our target person crossing into a restricted zone, a phone placed nearby **physically buzzes and alarms out loud** — just like a real border-post siren. No special hardware needed, just a spare phone.

BOTTOM LINE

We are not making the project smaller. We are making it **real**: live video, the same powerful AI, running on the laptops we already have — ready by 20 September.

WHAT STAYS EXACTLY THE SAME (NOT THROWN AWAY)

Face Recognition	Number Plate Reading (ANPR)	Zone Alerts	Night Vision	Suspicious Behaviour
Finds a specific wanted person	Reads vehicle plates automatically	Flags anyone entering a restricted area	Enhances footage in the dark	Loitering, pacing, sudden movement

Only the video source and the on-screen result are changing — from "upload a file, wait, watch later" to "connect a live camera, see it happen now." Every AI module above keeps running exactly as already built and tested.
